

Splufic Python Training

Welcome to the instructor-led Training for week three day one

Topics Covered

- Writing/Documenting a Python program
- conditional statements
 - 1-way, 2-way, multi-way
 - Nesting
- Python standard Library
- Iteration through sequence objects
- User Defined Functions

Writing/Documenting a Python program

- We have worked in the interactive mode
- To write python scripts/code, it has to be saved in a file with **.py** as the extension
- This file forms the basis of **Python Modules**
- A module is simply a file containing Python code. Every file containing Python code and whose file name ends in .py is a Python module. The file hello.py we created is a
 - **Built-in Modules**
 - **User defined modules**

Python standard Library

- Python programming language comes with a standard library that includes
 - **functions** such as `max()`, `sum()`, `random()` and
 - **classes** such as `int`, `str`, and `list`.

Python standard Library (Cont'd)

- The Standard Library includes modules to support, among others:
 - • Network programming
 - • Web application programming
 - • Graphical user interface (GUI) development
 - • Database programming
 - • Mathematical functions
 - • Pseudorandom number generators
- We will eventually use all of these modules. Right now we will see how to use the math and
- fraction modules.

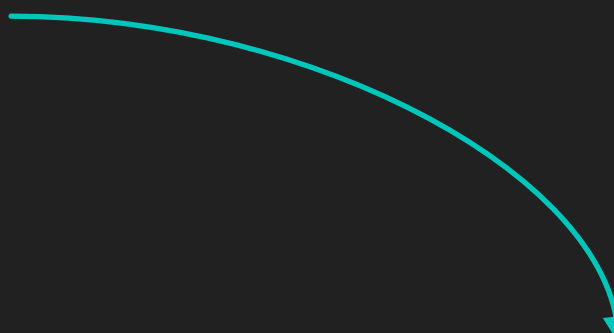

Math Module

Function	Explanation
<code>sqrt(x)</code>	\sqrt{x}
<code>ceil(x)</code>	$\lceil x \rceil$ (i.e., the smallest integer $\geq x$)
<code>floor(x)</code>	$\lfloor x \rfloor$ (i.e., the largest integer $\leq x$)
<code>cos(x)</code>	$\cos(x)$
<code>sin(x)</code>	$\sin(x)$
<code>log(x, base)</code>	$\log_{base}(x)$
<code>pi</code>	3.141592653589793
<code>e</code>	2.718281828459045

Conditional Statements

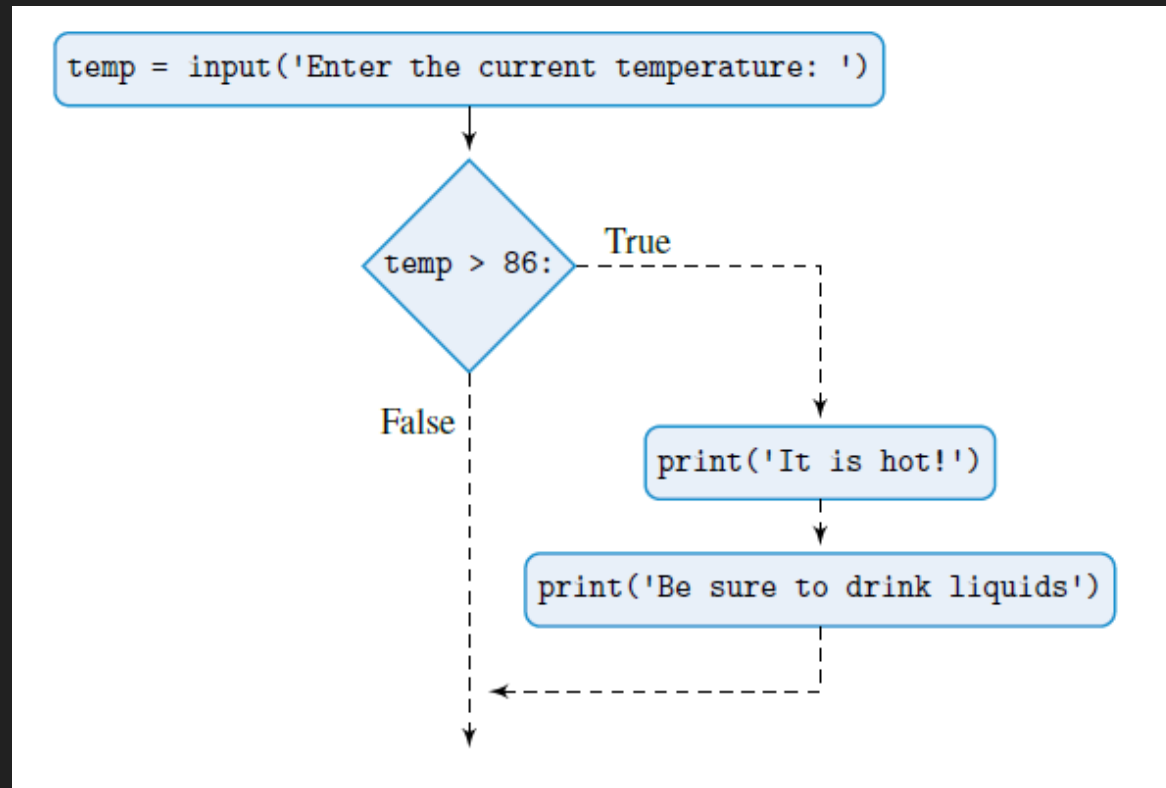

- Every python programs executes line by line
- We can **control** which statements are executed and which statements should be executed repeatedly.
- Conditional statements are used in **control structures**
- Single selection - 1-way
 - **If**
- Double selection - 2-way
 - **If/else**
- Multiple selection - multi-way
 - **If if/else**

Structures that
determines the flow of
your program

Single Selection

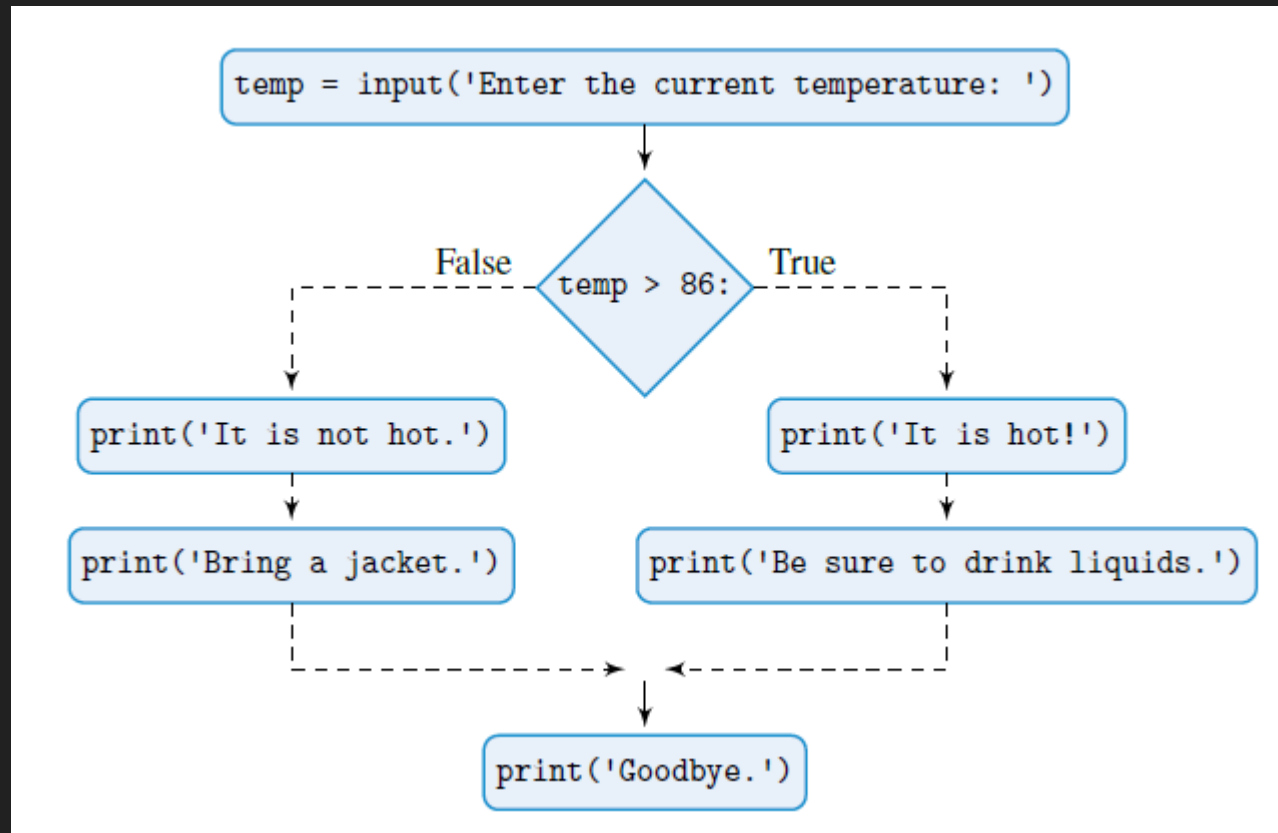

Example flowchart:

**Mainly used to make
One-Way Decisions**

Double Selection

Example flowchart:

Mainly used to make
Two-Way Decisions

Iteration through sequence objects

- Iteration is the process of repeating a particular operation or task a number of times
- We can iterate through lists and strings
- The Python **for** loop statement can be

Class Work 1

Translate these into Python if/else statements:

(a) If year is divisible by 4, print 'Could be a leap year.'; otherwise print 'Definitely not a leap year.'

(b) If list ticket is equal to list lottery, print 'You won!'; else print 'Better luck next time...'

Class Work 2

Implement a program that requests the current temperature in degrees Fahrenheit from the user and prints the temperature in degrees Celsius using the formula

$$\text{celsius} = \frac{5}{9}(\text{fahrenheit} - 32)$$

Your program should execute as follows:

```
>>>
```

```
Enter the temperature in degrees Fahrenheit: 50
```

```
The temperature in degrees Celsius is 10.0
```

Class Work 3

Implement a program that starts by asking the user to enter a login id (i.e., a string).

The program then checks whether the id entered by the user is in the list ['joe', 'sue', 'hani', 'sophie'] of valid users.

Depending on the outcome, an appropriate message should be printed. Regardless of the outcome, your function should print 'Done.' before terminating.

Here is an example of a successful login:

```
>>>
```

```
Login: joe
```

```
You are in!
```

```
Done.
```

And here is one that is not:

```
>>>
```

```
Login: john
```

```
User unknown.
```

```
Done.
```

The background consists of a teal upper section and a black lower section, separated by a jagged horizontal line. The teal section has a fine, diagonal hatching pattern.

Questions?
